

ABSTRACT

PART 1: THE COMPOSITE EFFECT AND HOLISTIC FACE PERCEPTION

1. INTRODUCTION: THE COMPOSITE FACE ILLUSION

2. THE COMPOSITE FACE EFFECT

3. HOLISTIC PERCEPTION OF INDIVIDUAL FACES

3.1. *Holistic face perception*

3.2. *Holistic/Configural processing, configuration and parts: some clarifications*

3.3. *Inversion*

3.4. *How are faces special(ly holistic)?*

3.5. *The role of a template derived from visual experience*

3.6. *The nature of the holistic face representation*

3.7. *Holistic face perception is functional*

Inversion (again)

Acquired Prosopagnosia

Long term impairments in face recognition

Gaze-contingency

3.8. *Correlating holistic face perception and face recognition performance*

Variability in face recognition performance and the rationale for correlation measures

(Weak) correlations can be found in the composite face paradigm

3.9. *Neuro-functional locus*

Capturing a perceptual phenomenon in neuroimaging

Human electrophysiology

3.10. *Convergent validity*

PART 2: THE MEASURE OF AN ILLUSION

4. THE COMPOSITE FACE PARADIGM

4.1. *The basic composite face paradigm*

4.2. *Why misalignment?*

Back to our Gestalist roots: (lateral) spatial misalignment is theoretically relevant

Breaking apart or increasing metric distances?

4.3. *Inversion (yet again)*

4.4. *Controlling for general effects of alignment*

4.5. *'Different' trials*

Why 'different' trials do not give rise to a composite face illusion/effect?

Should Signal Detection Theory be used to analyze the composite face paradigm?

4.6. *Looking for a response bias*

A response bias of perceptual origin

Composite face effects can arise without a behavioural same/different response (bias)

4.7. *Proportion of same and different trials*

- 4.8. *The importance of response times*
- 4.9. *Top and bottom*
- 4.10. *Mind the gap*
- 4.11. *Can object-based attention account for the composite face effect?*
- 4.12. *Other stimulus issues*
- 4.13. *Summary and conclusions of part II*

PART 3: THE ILLUSION OF A MEASURE

5. THE CONGRUENCY/INTERFERENCE PARADIGM WITH COMPOSITE FACES

- 5.1. *The roots of the congruency/interference composite face paradigm*
- 5.2. *The congruency paradigm has a built-in response conflict confound*
- 5.3. *Missing a misaligned condition*
 - Interference without integration: two examples
- 5.4. *A congruency effect on different trials reflects part-based processing*
 - Misinterpreting response bias
- 5.5. *Summary*
 - Multiplying the chances to find “holistic processing”

6. GRC'S OVEREXTENDED CONGRUENCY DESIGN: METHODOLOGICAL CONFOUNDS

- 6.1. *Stimulus confounds*
 - Misaligned aligned faces
 - The width of a circle
 - Lumping together the top and bottom face halves trials does not help integration
- 6.2. *Change of format confound*
- 6.3. *Spatial attention confounds*
 - Lateral shifts of attention for misaligned trials
 - Switching attention between top and bottom
- 6.4. *A too complex paradigm*
- 6.6. *Summary*
- 6.7. *GRC's criticisms of the standard composite paradigm: a short rebuttal*

7. UNFOUNDED CLAIMS FROM USING THE OVEREXTENDED CONGRUENCY DESIGN

- 7.1. *A decisional locus for holistic processing?*
- 7.2. *Prosopagnosia*
- 7.3. *Exposure duration*
- 7.4. *“Holistic” processing of inverted faces*
- 7.5. *Object processing and Visual Expertise*

8. GENERAL CONCLUSIONS
